NUTEC introduces nuFace™ software that uses a highly intuitive Graphic User Interface (GUI) to make motion control a convenient experience, even in the most demanding production environments.

Deer Park, NY – July 2010 – NUTEC COMPONENTS, INC., a leading manufacturer of advanced precision motion systems, is now marketing its innovative nuFACE™ software, a convenient, flexible, off-the-shelf PC Windows-based motion control platform that adapts to virtually any multi-axis servo controlled motion system or sub-system.

The designers of nuFACE paid special attention to the placement of user controls located on the touchscreen-enabled Graphic User Interface (GUI) to provide ergonomic, easy-to-understand and highly intuitive graphics that simplify motion control by allowing non-technical personnel to quickly customize, program and operate all types of multi-axis mechatronic systems, including new equipment and retrofit applications.

Decades of expertise in motion control led NUTEC to incorporate such notable features as real-time visual tracking of G-Code execution measured in metric, imperial or user units; a built-in text editor to quickly modify and debug G-Code files; automatic and manual feedrate adjustments using the GUI jog control palette; touchscreen-enabled keyboard and button controls for intuitive Man-Machine Interface (MMI); parts counter for Cylindrical Micro-machining System (CMS) applications; water flow rate monitoring capabilities; USB connectivity for process verification using CCD cameras, and serial port connections for user-specific control, monitoring and reporting.

This highly flexible software platform can be easily customized based on user preferences, including multi-level secure access for operators, service technicians or engineers, and buttons that can be easily renamed to reflect specific IO needs or to match peripheral device interfaces.
